

Module 4: Methodologies

Session 2: Assessment, Analysis and Reporting

Session Objectives

Upon completion of the session, the participants will be able to:

1. Identify the 7 assessment principles;
2. Explain how to analyse data in RDANA; and
3. Determine the reporting procedures in RDANA

Session Duration: 1 hour lecture

Materials:

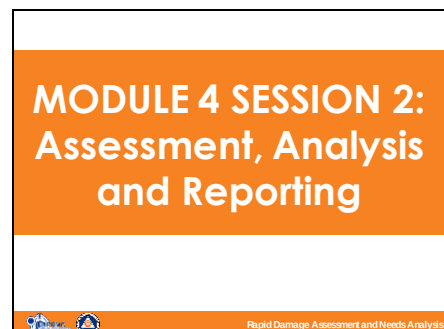

- LCD projector
- White screen
- Laptop
- Trainee's Manual

Teaching-Learning Methodologies

- Interactive lecture/discussion

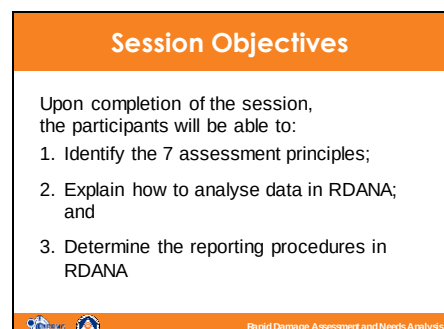

Introduce yourself:

I am (name and agency) and I will be your instructor for this module. We are now in the second session of the fourth module of RDANA. Session 2 explains how to assess, organize and report the data gathered from the conduct of RDANA.

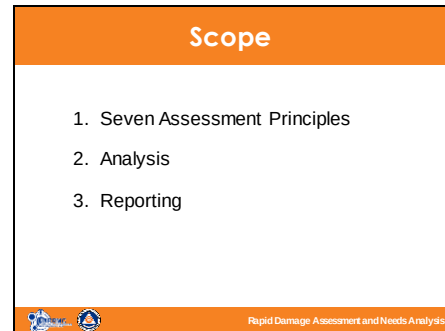

Note to the Facilitator:

Read the objectives, or invite a participant to read.

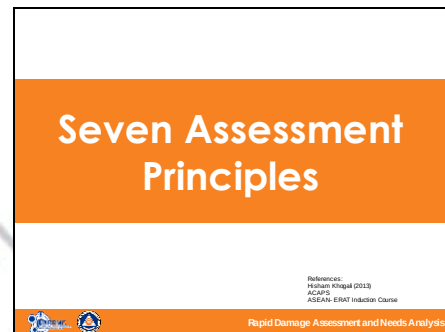

Note to the Facilitator:

Read the scope of the presentation, or invite a participant to read.

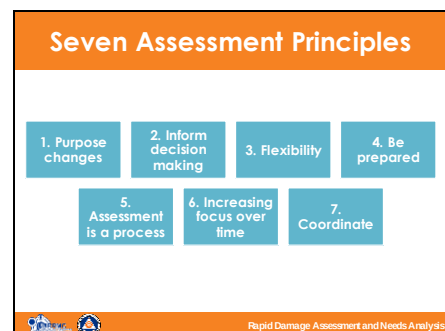

We are going to discuss the seven assessment principles as presented by Hisham during the 3rd ASEAN- ERAT induction course.

Seven Assessment Principles

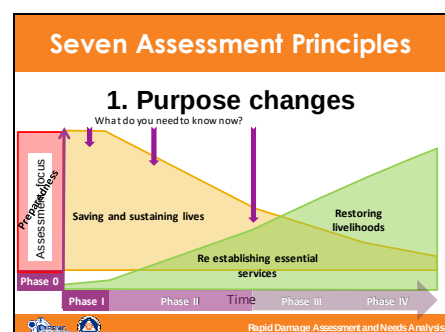

Here are the seven assessment principles. We are going to discuss each.

Seven Assessment Principles

1. Purpose changes.

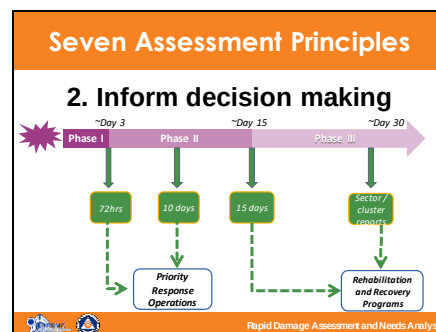

There are several phases of assessment from Phase 0 to IV. The purpose changes for each phase. The early phases are focused on saving and sustaining lives. As the phases pass, the purpose shifts to re-establishing essential services and restoring livelihoods. ERAT is involved in Phases I to the early parts of Phase II.

Seven Assessment Principles

2. Inform decision-making

This slide is adapted from the ACAPS presentation. The information gathered by the assessment must aid decision making. In the early phases, the information to be gathered by RDANA should allow the officials to decide the immediate recovery needs. In the latter phases, the information to be gathered by PDNA shall allow the officials to undertake detailed assessment of the sectors and clusters to determine the comprehensive rehabilitation and recovery programs.

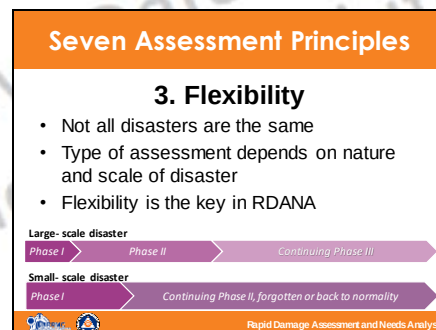

Seven Assessment Principles

3. Flexibility

Remember:

- Not all disasters are the same.
- The type of assessment depends on the nature and scale of disaster.
- Therefore, flexibility is the key in RDANA

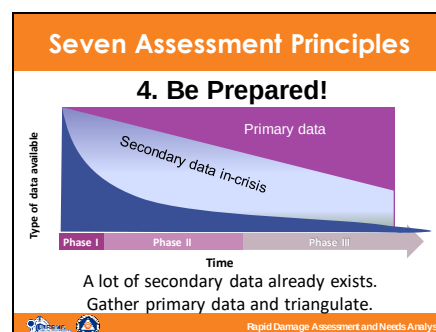

For large-scale disasters, assessment extends to many days. But for small-scale disasters, assessment may only reach up to Phase II until it reverts back to normal condition.

Seven Assessment Principles

4. Be Prepared!

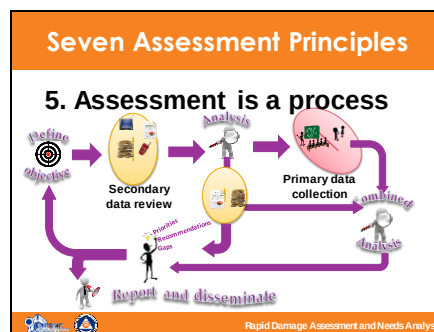

During Phase I, a lot of secondary data already exist but there are no primary data available yet. As the assessment moves proceeds, the task of the Team is to gather primary data and triangulate the findings of secondary data review. Moreover, situations on the ground change and, as a consequence, objectives, methods and type of data to be collected may shift. The RDANA team should be prepared for this.

Seven Assessment Principles

5. Assessment is a process

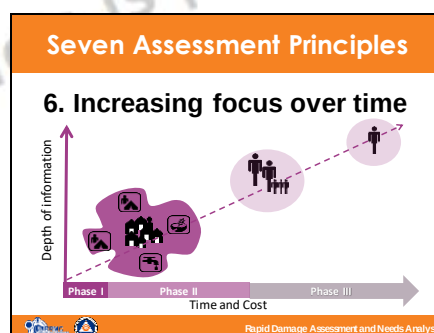

In the emergency response context, assessment is the process by which we gather, collect and analyze available data in order to make decisions regarding response activities. Assessment follows a systematic series of activities which starts from planning and ends in dissemination of gathered data. However, it is important to remember that assessment is not a one-time, big-time event but rather a continuous process of collecting and interpreting data on the ground. This is due to the ever- changing focus of assessment as response unfolds, and consequently, decision- makers may need new data to solve emerging issues and needs.

Seven Assessment Principles

6. Increasing focus over time

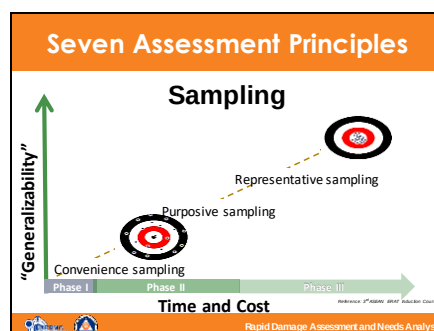

The focus of response activities shifts from the community to the individual as the disaster phase progress. Since RDANA is about an overview of the disaster, the focus is at the community level. Hence, only the priority needs of the entire community are provided at the early phase of assessment. As the phases move on, the focus shifts to the household and finally, to the individual level. Once the focus is on the individual level, the government is now able to conduct comprehensive rehabilitation and recovery programs to cater to the needs of every individual in the community.

Seven Assessment Principles

Sampling

The need for a more generalizable data increases as the disaster phase progresses. During Phase I, non- probability sampling techniques are used for gathering data. Respondents are chosen through convenience sampling, wherein participants of surveys are selected based on who are available at the moment. During Phase II, the goal and

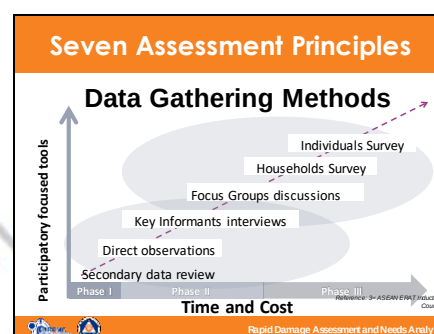

methods of assessment change as discussed in the previous slides. As a result, sampling techniques shift to purposive sampling wherein data are collected from individuals who can provide data that are representative of the target population. Beyond Phase II, data collection is conducted at the household and individual levels. More rigorous probability sampling methods are employed in order to increase the generalizability of data.

Seven Assessment Principles

Data Gathering Methods

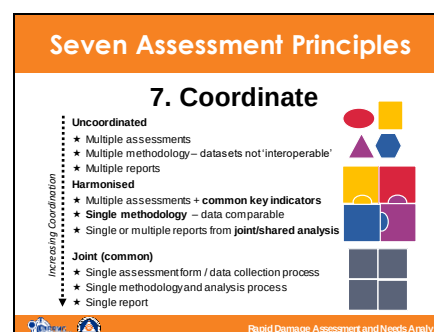

Our interview types and tools shift, as well, from direct observations to individual surveys.

Seven Assessment Principles

7. Coordinate

Coordinated assessments are those which are planned and carried out in partnership with other humanitarian actors, with the results shared for the benefit of the broader humanitarian community to identify the needs of the affected population of a humanitarian crisis.

Such assessments range from inter- and intra-cluster/sector joint assessments to single agency assessments that are harmonized.

Harmonized assessment: Data collection, processing and analysis are undertaken separately. However, the data are sufficiently comparable (due to the use of common operational datasets, key indicators, and geographical and temporal synchronisation) to be compiled into a single database, and to serve as the subject of a shared analysis.

Joint Assessment: Data collection, processing and analysis form one single process among agencies

within and between clusters/sectors. This leads to a single report. This is sometimes also referred to as a “common assessment”.

In contrast, uncoordinated assessments are those in which data sets are not inter- operable, and the results cannot be used to inform the overall analysis.

In RDANA, we are targeting to have a common assessment. This is why it is important for the ERAT to work together as a team and to include multi- cluster membership.

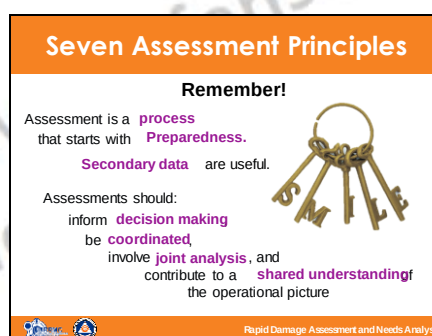

Seven Assessment Principles

Note to the Facilitator:

This is an animated slide

Here are the important points to remember in conducting assessments:

- (Click 1): Assessment is a process that starts with preparedness.
- (Click 2): Secondary data are useful
- (Click 3): Assessments should:
- (Click 4): Inform decision- making
- (Click 5): Be coordinated
- (Click 6): Involve joint analysis
- (Click 7): Contribute to a shared understanding of the operational picture

Seven Assessment Principles

Remember!

Assessment is a **process** that starts with **Preparedness**.

Secondary data are useful.

Assessments should:

- inform **decision making**
- be **coordinated**
- involve **joint analysis**, and
- contribute to a **shared understanding** of the operational picture

Rapid Damage Assessment and Needs Analysis

Phases I and II Assessments are tug of war

Finally, there is a need to reconcile accuracy and completeness versus urgency to produce a report. Remember, in Module 1, there is a need to have a balance between speed and accuracy. Most of the time, speed is much more important because people are waiting to be rescued and to be provided with assistance. However, never compromise accuracy and give a half- baked assessment. Include all your sources of data and recommend the need to conduct further assessment.

Phases I and II Assessments are tug of war

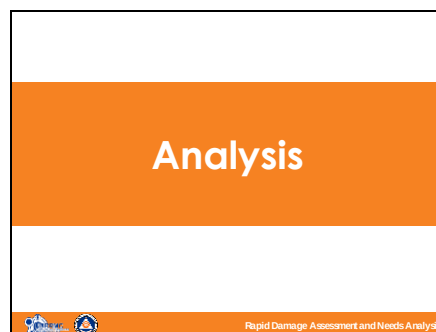

Two teams of animals are pulling on a rope attached to a sign that says "RULE OF LAW?".

Left team (elephants): "No! Wait! We need more information..."

Right team (horses): "Hurry up! We need to produce a report..."

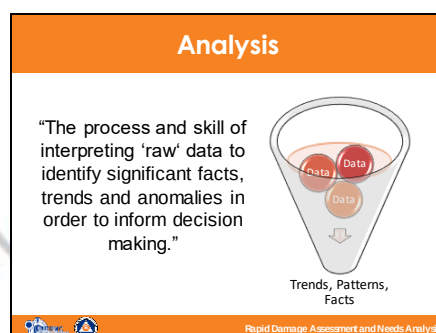

Rapid Damage Assessment and Needs Analysis

Let us now move on to analysis of data.

Analysis

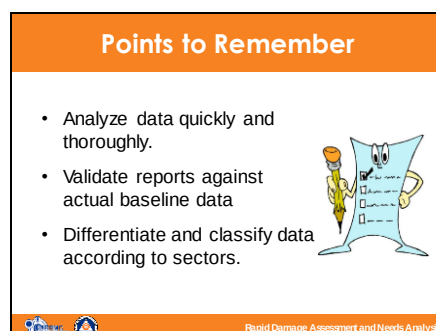

ASEAN- ERAT defines data analysis as the process and skill of interpreting “raw” data to identify significant facts, trends and anomalies in order to inform decision- making. It is an on-going process that should start during the secondary data review and continue during the data collection phase.

Points to Remember

Primary data should be analyzed together with secondary data. In doing so, here are some tips that the RDANA Team should keep in mind:

- Data have to be analyzed and interpreted quickly and thoroughly.
- Cross-check and compare reports against actual baseline data for validity.
- Differentiate and classify the needs according to sectors.

Points to Remember

- Avoid interpretation that does not prescribe concrete actions.
- Detect and recognize trends and indicators of problems.
- Estimate how the situation might develop in the future.

Points to Remember

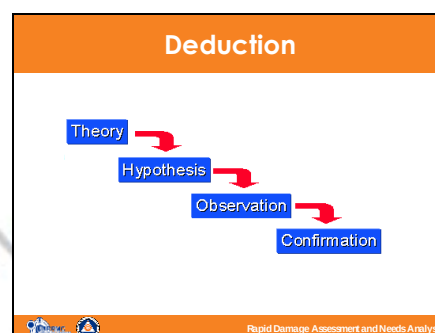

- Avoid interpretation that does not prescribe concrete actions.
- Detect and recognize trends and indicators of problems.
- Estimate how the situation might develop in the future.

 Rapid Damage Assessment and Needs Analysis

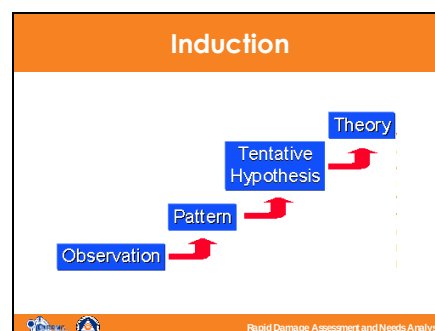

Deduction

There are three analysis methods that can be used in drawing conclusions. The first one is deductive reasoning which works from the more general to the more specific. Sometimes this is informally called a "top- down" approach.

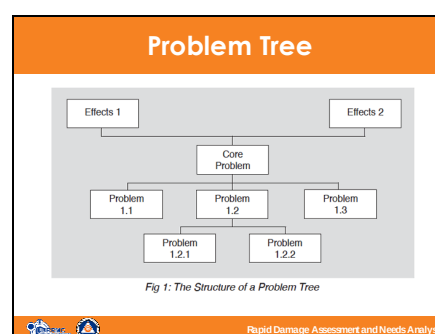

Induction

On the other hand, inductive reasoning moves from specific observations to broader generalizations and theories. Informally, we sometimes call this a "bottom- up" approach.

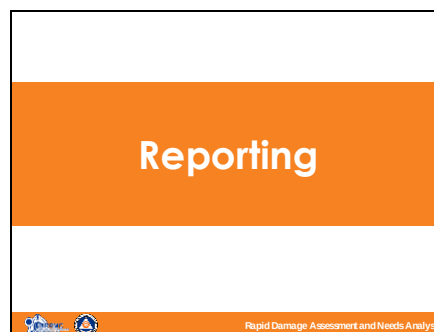

Problem Tree

The problem tree is a problem analysis tool which is primarily used for analyzing and identifying appropriate objective or focal problem. It gives a clear and systematic presentation of the main issues, as seen in the assessment process, and all the other background issues connected these issues. The identified problems are displayed in a hierarchical order, showing the cause- effect relationship of the various problems identified.

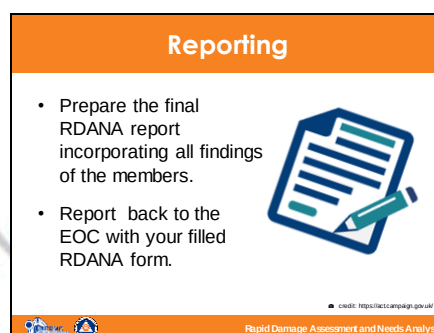

Reporting is one of the most important functions of an ASEAN- ERAT Team. Reports should be clear, concise, accurate and professional. As per ASEAN- ERAT Guidelines, the team leader should clear the reports before being released.

Reporting

- Once the RDANA Team receives the Mission Termination message from the EOC, it should consolidate and analyse the gathered data.
- After data consolidation and analysis, the team shall prepare the Final RDANA Report using all assessment findings with photos.
- Mission expenses should be recorded and receipts should be compiled.
- The RDANA Team shall then report to the EOC and shall submit filled- out RDANA Forms.

RDANA Form

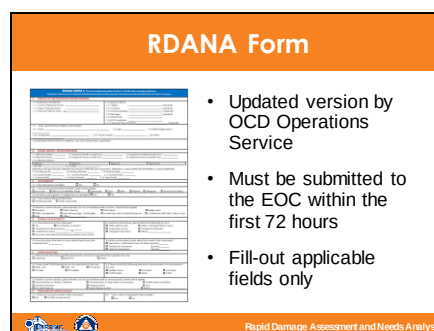

Note to the Facilitator:

Explain the RDANA form to the participants. Have the assistant instructor/secretariat provide copies of the form to each participant.

Emphasize that the RDANA form is adapted from the following:

- NDRRMC Report Development Workshop– Forms I and II
- ASEAN- ERAT Daily Assessment Form for ARF DIREX
- ASEAN RDANA Manual Quick Reference Guide December 2008
- Initial Needs Assessment Checklist (INAC)– Version 06/05/10

Further, explain that the form is currently being used. Presently, the OCD Operations Service is

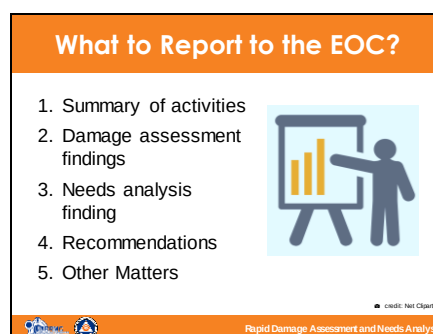

looking into enhancing the form and even coming up with an online version.

What to Report to the EOC?

The RDANA Report should contain the following:

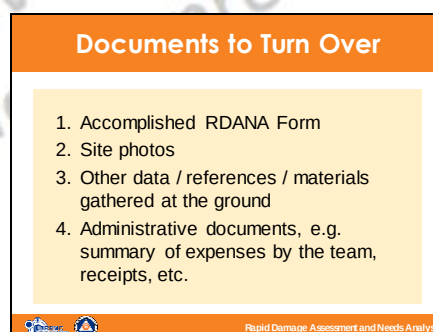

1. Summary of Activities (sites visited with photos)
2. Damage Assessment Findings
3. Needs Analysis Findings
4. Recommendations
 - Priorities for response
 - Need for conduct of another RDANA
 - Need for detailed cluster/sectoral assessment
5. Other Matters

Documents to Turn Over

After the mission or assessment has been terminated, the RDANA Team should turn over the following documents together with the report:

1. Accomplished RDANA form
2. Site photos
3. Other data / references / materials gathered at the ground
4. Administrative documents. eg: summary of expenses by the team, receipts, etc.

Note to the Facilitator:

Ask the participants if they have questions or points to be clarified.

Note to the Facilitator:
Read the module summary.

Module Summary

- There are seven assessment principles that must be observed.
- Classify the type of data available whether it be primary or secondary.
- Assess and analyze the data.
- After the latter, commence reporting given the guidelines.

 Rapid Damage Assessment and Needs Analysis

Note to the Facilitator:
Read the objectives. Ask participants if the identified objectives were all met

Session Objectives

Upon completion of the session, the participants will be able to:

1. Identify the 7 assessment principles;
2. Explain how to analyse data in RDANA; and
3. Determine the reporting procedures in RDANA

 Rapid Damage Assessment and Needs Analysis

Learning Insight

“When crisis, strife and misery are at their worst, we need to know what is needed to start saving lives and help people help themselves.”

- Jan Egeland Secretary General, Norwegian Refugee Council

It is prudent to have a plan in hand, to know exactly what to do and when to do it, to be able to minimize wastage of time and energy in times of crisis.

Learning Insight
